

# Geisinger Medical Center, Danville Stroke Program Outcomes Data

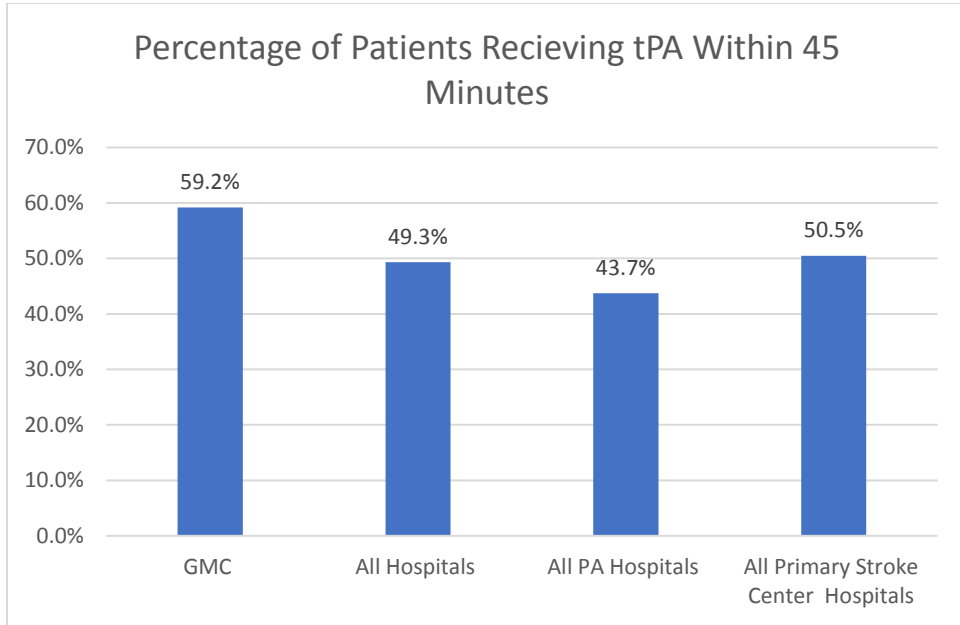

Our stroke team treats more than 600 ischemic and hemorrhagic stroke patients annually.

Geisinger's Stroke Program offers advanced care from a variety of specialists providing comprehensive stroke treatments and stroke prevention therapies.

Geisinger Stroke Program recognizes every minute makes a difference. Clot-busting medication known as tissue plasminogen activator (tPA) can restore blood flow to the brain for patients meeting specific criteria. The medication must be given within a certain period of time. Early identification and treatment for selected patients can increase your chances of a greater functional outcome after your stroke.

Geisinger is committed to providing the highest quality of care. We closely monitor our compliance with a variety of quality measures endorsed by the Joint Commission. Our ability to meet these quality measures is benchmarked with hospitals nationwide.
